COURIER MANAGEMENT SYSTEM

5. PROJECT DEVELOPMENT PHASE

5.1 Development Environment

The Courier Management System is developed using a suitable application development environment. The system uses structured data objects, custom fields, relationships, validation rules, security configuration, reports, and dashboards. The development environment supports the management of customers, couriers, parcels, delivery details, and tracking information

5.2 Custom Objects

Object	Record Name	Purpose
Customer	Customer Name	Stores customer details, contact information, and address.
Courier	Tracking Number	Stores courier and parcel information for tracking.
Delivery	Delivery ID	Stores pickup, dispatch, delivery status, and delivery date.
Staff	Staff Name	Stores staff details and information related to courier operations.

5.3 Courier Object Fields

Field	Type / Values
Courier Type	Picklist: Document, Parcel, Package
Delivery Status	Picklist: Booked, Dispatched, In Transit, Delivered
Tracking Number	Text
Weight	Number
Destination	Text
Customer	Master-Detail relationship with Customer

5.4 Delivery Object Fields

Field	Type / Details
Delivery ID	Text
Pickup Date	Date
Expected Delivery Date	Date
Actual Delivery Date	Date
Delivery Charge	Currency

Delivery Status	Picklist
Courier	Lookup relationship to Courier

5.5 Customer Object Fields

Field	Type / Details
Contact Number	Phone
Email	Email
District	Picklist
Address	Text Area

5.6 Staff Object Fields

Field	Type / Details
Contact	Phone
Email	Email
Address	Text Area
Staff Role	Picklist: Administrator, Staff, Delivery Agent

5.7 Lightning App

A Salesforce Lightning application named “Courier Management System” is configured with Customer, Courier, Delivery, Staff, Reports, and Dashboards tabs. The application provides an organized interface for managing courier operations, customer information, delivery details, and tracking activities.

5.8 Security and Access Configuration

- Administrator and Courier Staff profiles are configured for system access.
- A Delivery Manager role is created to manage courier and delivery operations.
- Appropriate user permissions are provided according to the user's responsibilities.
- Sharing rules are configured to provide access to required courier and delivery records.
- Customer information is protected from unauthorized access.
- Access to important records is controlled using profiles, roles, and sharing rules.

5.9 Development Summary

The development phase converts the design of the Courier Management System into a working application with structured objects, fields, relationships, validation, and controlled access. The system manages customer, courier, parcel, and delivery information. Reports and dashboards provide useful information for monitoring courier operations, delivery status, and overall system performance.
