COURIER MANAGEMENT SYSTEM

7. PROJECT DOCUMENTATION

7.1 Documentation Overview

- Project documentation provides a complete record of the Farm Management System.
- It explains the purpose, requirements, architecture and development process of the project.
- It also includes information about testing activities, advantages and limitations.
- The documentation describes possible future improvements and extensions of the system.
- It helps users and developers understand how the system works and how it can be maintained.

7.2 Documentation Contents

- The documentation contains all the important information related to the Farm Management System.
- It includes the project overview, purpose, objectives and problem statements.
  Functional and non-functional requirements explain what the system should do and how it should perform.
- System architecture, development walkthrough and testing details describe the technical implementation.
- It also includes advantages, disadvantages, limitations, future scope and an appendix.

7.3 Project Purpose

- The main purpose of the project is to provide a centralized platform for managing agricultural information.
- The Salesforce-based system can store information about farms, crops, farmers and buyers.
  It helps organize agricultural data in a structured manner.
- The system also supports reports and dashboards for better visibility of information.
  Controlled access helps ensure that users can access the information according to their permissions

7.4 Advantages

- The system provides a centralized place to manage farm and agricultural data.
- It reduces paperwork and minimizes the need for maintaining manual records.
- Data can be organized more efficiently, which can improve accuracy and accessibility.
- Reports and dashboards provide real-time visibility into available information.
- Role-based and cloud-based access allows authorized users to access information when required

7.5 Disadvantages and Constraints

- The system requires a reliable internet connection because it uses cloud-based access.
- It depends on the Salesforce platform and may require suitable licensing.
- Offline functionality is limited when users cannot connect to the cloud platform.
- Users need appropriate permissions to access different parts of the system.
- Basic knowledge of the platform may also be required for users to work with the system effectively.

7.6 Future Scope

- The system can be improved by integrating a mobile application for field users.
- AI-based crop prediction and recommendations can be added to support agricultural decisions.
- IoT sensors can be integrated to monitor farm conditions and collect information.
- Weather-data integration can provide useful environmental information for farming activities.
- Future versions can also include market-price forecasting, advanced analytics and intelligent alerts.

7.7 Documentation Deliverables

- The project documentation includes all major documents created during the development process.
- Requirement documentation explains the needs and expectations of the system.
- Design and architecture documentation describes the structure and organization of the system.
- Development configuration and testing documentation record how the system was developed and tested.
- It also includes the user demonstration procedure and a plan for future enhancements.

7.8 Conclusion

- The documentation provides a structured record of the complete Farm Management System.
- It covers the project from problem identification through development and testing.
- It helps provide a clear understanding of the system and its important components.
- The documentation also identifies limitations and possible areas for future development.
- Overall, it provides a foundation for improving and extending the Farm Management System in the future.
